

# Dairy National Chemical Contaminants Programme

## – Raw Milk Result Summary July 2011 to June 2012

This Dairy National Chemical Contaminants Programme (NCCP) Report provides a summary of results for the full 2011/12 dairy season, spanning the period July 2011 to June 2012. The purpose of the NCCP is to:

- (a) provide an assurance that not less than 99% of raw milk, including colostrum, conforms to New Zealand and international requirements at the farm gate;
- (b) confirm the accuracy of attestations provided to other competent authorities; and
- (c) investigate unfavourable findings to ensure that controls remain effective and that emerging hazards are identified and an appropriate regulatory measures applied.

### **What we tested:**

- 303 raw milk samples over 7 random sampling rounds across the full period 1 July 2011 to 30 June 2012 (329 milk samples in 2010/11 and 321 samples in 2009/10)
- 1 targeted colostrum round of 47 samples (40 in 2010/11 and 2009/10)

All random sampling of raw milk and colostrum under the raw milk programme occurs at the farm bulk milk tank prior to any further consolidation, comingling or dilution.

### **What we looked for:**

- Approximately 530 compounds or elements including:
  - Antibiotics and other veterinary medicines
  - Pesticides
  - Herbicides
  - Fungicides
  - Persistent organic pollutants
  - Other compounds withdrawn or not permitted for food producing animals
  - Aflatoxins
  - Incidental contaminants
  - Chemical elements, and
  - Radionuclides

In total some 176,517 individual test results were obtained for the 350 raw milk and colostrum samples.

## What we found:

Of the 152,407 individual test results for raw milk (excluding colostrum) there were only 67 detections (0.04%), of which 2 detections were above a recognised acceptance limit (0.001%). This represents a conformance rate of 99.999%.

For the 47 colostrum samples collected there were 24,110 test results in total, with 36 residues detected (0.15%) of which 2 results were above the Action Limit for *p,p'* DDE on an as received basis (0.008%). One of the two samples concerned was confirmed compliant following correction based on fat content.

One colostrum sample contained a beta-lactam antibiotic at the tolerance limit.

### ***Compounds detected above acceptance limits***

	Raw Milk	Colostrum
DDE	2	1

Trace back investigations confirmed that, for each of the individual supplies identified with DDE above acceptable limits at the farm, the milk or colostrum for processing conformed to all applicable acceptance limits at the point of receipt at the respective manufacturing premises.

The detections of interest were:

- As stated above, two milk samples and one colostrum sample were found to exceed the Codex limit for *p,p'* DDE. All samples were below the New Zealand MRL of 1.25 mg/kg on a fat basis and all were also under 0.04 mg/kg when corrected to a 4% milkfat basis.

In total 19 of the 47 colostrum samples had a detectable level of DDE, representing 40% of samples (down from 50% of colostrum samples in 2010/11). A total of 57 (19%) raw milk samples had a detectable level (up 9% in 2010/11).

Metabolites of DDT are periodically identified very early in lactation from animals grazing land where DDT was historically applied to control “grass grub” (*Costelytra zealandica*).

In 1970, New Zealand became one of the first countries in the world to ban the use of DDT on pastoral land. Most commonly residues of DDE, rather than the parent compound DDT, are identified which confirms historic rather than recent use of this pesticide in New Zealand.

- One colostrum sample contained a beta-lactam antibiotic at the tolerance limit. For 2011/12 colostrum samples were not tested for beta-lactams by LC-MS, and consequently the number of detections below the Action Limit is significantly lower for 2011/12.
- Two raw milk samples and one colostrum sample were found to contain Aflatoxin M<sub>1</sub> at levels well below the EC limit, and significantly below the CODEX recommended limit. This is a lower rate of detections than 2010/11 despite an increase in the number of samples tested.
- Seven colostrum samples were found to contain a phthalate at low levels (4 x DEHA, 2 x DEHP and 1 x DEP) and one milk sample was found to contain a low level of DEHA. All detections were well below 1mg/kg. Investigations indicated that the phthalates identified were due to migration from rubberware and, despite the levels detected being very low, the industry has been proactive in moving to new rubber formulations. Contaminant migration standards for milk contact materials are also applied through the *Code of Practice the Design and Operation of Farm Dairies (NZCP1)*.
- Two samples were found to contain cyanuric acid at levels well below the 1mg/kg action limit. MPI has previously investigated low level findings thoroughly and has confirmed that these are not linked to any form of milk or feed adulteration.

At 0.06% the overall rate of detections for the programme is below previous years (0.08% in 2010/11, 0.13% in 2009/10 and 0.12% in 2008/09). This is largely due to the wider range of compounds now being screened, with the 67 residue detections in raw milk samples being marginally above the 61 detections in 2010/11 and in line with the 69 detections in 2009/10.

## Conclusion:

Because the sampling occurs at the farm prior to consolidation these results continue to give a high level of confidence that New Zealand dairy products meet the acceptance limits for chemical residues and contaminants that are applied internationally.

Furthermore, a review is undertaken whenever a test result indicates that a compound might be present at a level above that permitted by New Zealand, Codex or an overseas market. Such reviews are undertaken regardless of whether the result was obtained by the Ministry for Primary Industries (MPI) through monitoring under the national chemical contaminants programme or by industry, and ensure that the dairy products manufactured in New Zealand conform in all respects to the requirements of the intended market(s).

A full summary of results from NCCP random monitoring and directed surveillance follow.
