EXECUTIVE SUMMARY

Anderson, O.F. (2014). Fish and invertebrate bycatch in New Zealand deepwater fisheries from 1990–91 until 2011–12.

New Zealand Aquatic Environment and Biodiversity Report No. 139. 60 p.

Commercial catch-effort data and fisheries observer records of catch by species provided by the Ministry for Primary Industries (MPI) were used to estimate the level of individual fish and invertebrate species bycatch in each fishing year from 1990–91 to 2011–12 for the following Tier-1 deepwater fisheries:

Trawl fisheries

- Arrow squid (SQU)
- Hoki/hake ling (HOK/HAK/LIN)
- Southern blue whiting (SBW)
- Jack mackerel (JMA)
- Orange roughy (ORH)
- Oreo (OEO)
- Scampi (SCI)

Longline fisheries

- Ling (LIN)

The estimation process for the ling longline fishery, and the arrow squid fishery excluding 2011–12, stratified according to fishery area, and estimates of precision were calculated using bootstrap methods. For the remaining fisheries no stratification was used and no estimates of precision were calculated.

1. INTRODUCTION

This report was prepared as an output from the Ministry for Primary Industries project DAE2010-02 “Bycatch monitoring and quantification of deepwater stocks” and addresses the following Specific objective for year-3.

4. To provide annual estimates of bycatch for nine Tier-1 species fisheries (SQU, SCI, HAK, HOK, JMA, ORH, OEO, LIN, SBW).

The purpose of this research was to compile a list of all fish and invertebrate bycatch species in New Zealand deepwater fisheries, with estimates of annual catch levels, which could be relatively rapidly produced and regularly updated. This would allow early detection of any downward (or upward) trends in bycatch of individual species in all Tier-1 deepwater fisheries, not just in the single fishery typically examined in any one year. By fine-tuning these estimates for the fishery under closer examination in each year (in this year the ling longline fishery) and providing estimates of precision, an overall picture of the annual bycatch of a large number of species, across each fishery, can be built up over multiple years—with increasing precision in each year.

This report provides the second iteration of this plan, the first (Anderson 2013a) provided fine-tuned estimates only for the arrow squid trawl fishery.

2. METHODS

Observer bycatch data were extracted from the MPI *cod* database for each of the Tier-1 species target fisheries (hoki/hake/ling trawl, jack mackerel trawl, orange roughy trawl, oreo trawl, southern blue whiting trawl, scampi trawl, arrow squid trawl, and ling longline) for the period 1990–91 to 2011–12. These data were subjected to the same error-checking procedures used for the arrow squid fishery by Anderson (2013b).

The total catch and frequency of capture of each bycatch species was examined in each fishery, and those species for which there was a total of less than 10 kg of observed catch over the entire 22-year period, or which were observed caught on five or less occasions, were disregarded. It was considered that either the capture of such species was so rare as to be irrelevant, or the likelihood was high that such records were the result of the species code being incorrectly recorded by the observer. Annual bycatch ratios for the remaining individual QMS and non-QMS species (fish and invertebrates) were then calculated for each fishery.

Commercial catch records were also obtained from the Ministry for Primary Industries for each fishery, groomed according to the procedures described in Anderson (2013b), then used to calculate annual effort (number of tows or longline sets) for each fishery.

For each fishery, excluding the ling longline fishery and all but the 2011–12 fishing year for the arrow squid fishery, the annual species specific bycatch ratios were multiplied by the annual effort in the fishery, without stratification, to produce simple estimates of total annual

bycatch without any estimates of precision. An indication of whether the bycatch of each species increased, decreased, or stayed relatively unchanged over time was calculated in the form of a slope coefficient for a loglinear regression fitted to the data.

For the ling longline fishery, the procedure was similar but was extended to include an estimate of precision derived from an area-stratified bootstrapping procedure used for the combined species groups (QMS, non-QMS, and invertebrates) in Anderson (2014). This procedure rounds the estimates of total annual catch to the nearest 0.1 t and so species with less than this level of catch in at least one year were excluded. The same procedure was applied to the arrow squid fishery in Anderson (2013a), except that estimates were rounded to the nearest 10 t, and the results are repeated here for the years 1990–91 to 2010–11; new (coarse) estimates were added for 2011–12.

See Anderson (2013b) for a more detailed description of the general methodology used to extract and groom observer and commercial fishing return data, calculate bycatch ratios and annual levels, and estimate precision.

Tables were constructed for each fishery showing the annual estimated bycatch for each species and the slope coefficient. For all years in the ling longline fishery and for all years except 2011–12 in the arrow squid fishery, the CV for each estimate was also provided. A colour-coded summary table is also provided, in order to clearly indicate the species in each fishery with declining or increasing catch levels.

3. RESULTS

Annual bycatch estimates for individual species in each of the nine Tier-1 fisheries are given in Tables 1 to 8. The following is a brief summary of these tables, including figures showing the annual bycatch of species showing the greatest increase and decrease over time. Note that in some cases the apparent increase or decrease in bycatch of a species is likely to be due to improvements in species identification, or changes in observer recording practices, over time. For example, in the arrow squid fishery, the increase in bycatch of smooth red swimming crabs (*Nectocarcinus bennetti*) appears to be at the expense of bycatch of the similar-looking paddle crabs (*Ovalipes catharus*), and the increase in bycatch of floppy tubular sponges in the hoki/hake/ling trawl fishery actually reflects the improved identification of sponges in more recent years. Where the possibility of this was strongly suspected in the species figured, it has been noted in the figure captions; for other species, e.g., slender jack mackerel, the changes in bycatch may reflect real changes in species abundance.

Arrow squid trawl fishery

- The most commonly caught bycatch species were barracouta (*Thyrsites atun*, BAR), silver warehou (*Seriolella punctata*, SWA), and spiny dogfish (*Squalus acanthias*, SPD).
- Of the 99 bycatch species examined, 13 have shown a decrease in catch over time and 38 an increase in catch.
- The species showing the greatest decline were paddle crabs (PAD), slender jack mackerel (*Trachurus murphyi*, JMM), and greenback jack mackerel (*Trachurus declivis*) (Figure 1).
- The species showing the greatest increase were smooth red swimming crab (NCB), silver dory (*Cyttus novaezealandiae*, SDO), and giant spider crab (*Jacquinotia edwardsii*, GSC) (Figure 1).

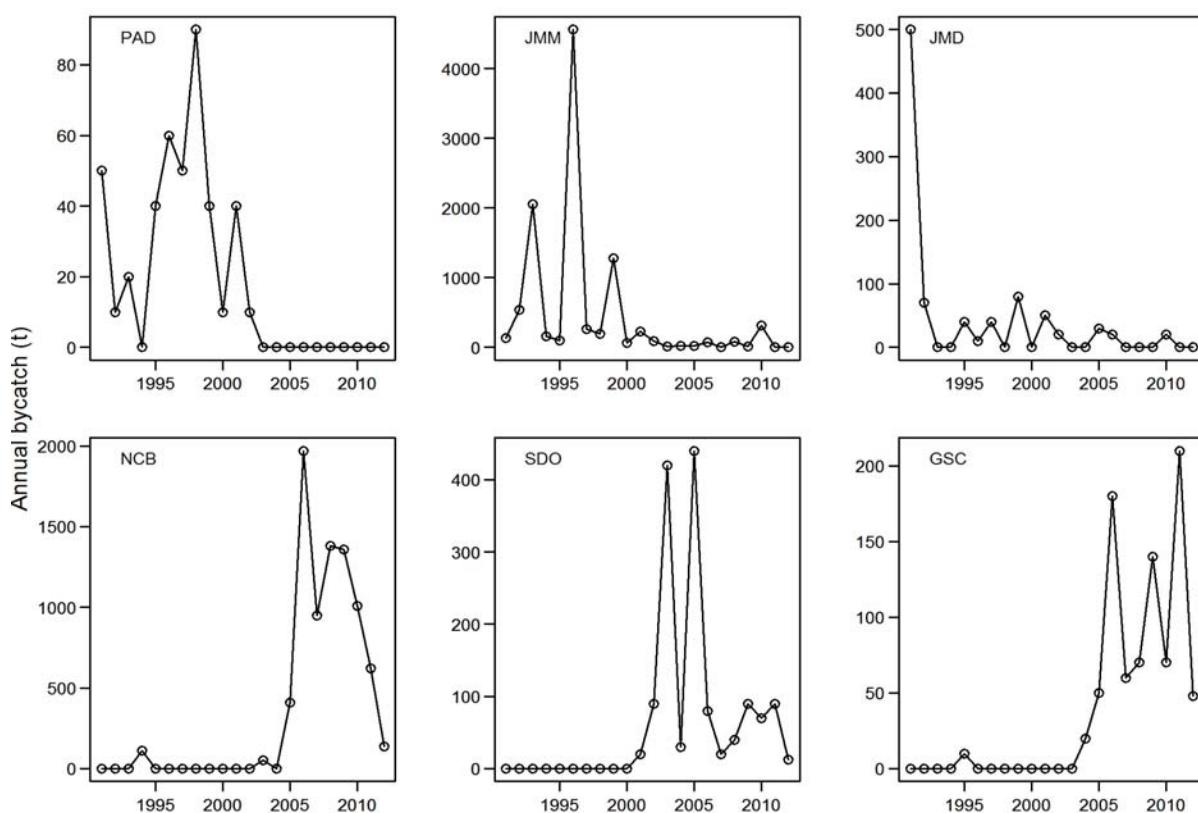

Figure 1: Annual bycatch estimates in the arrow squid trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2011–12. See text above for explanation of the species codes. Note: the increase in PAD and decrease in NCB may be due to NCB being erroneously recorded as PAD before 2003–04.

Southern blue whiting trawl fishery

- The most commonly caught bycatch species were ling (*Genypterus blacodes*, LIN), hoki (*Macruronus novaezelandiae*, HOK), and hake (*Merluccius australis*, HAK).
- Of the 68 bycatch species examined, 12 have shown a decrease in catch over time and 4 an increase in catch.
- The species showing the greatest decline were hoki (HOK), moonfish (*Lampris guttatus*, MOO) and dark ghost shark (*Hydrolagus novaezealandiae*, GSH) (Figure 2).
- The species showing the greatest increase were opah (*Lampris immaculatus*, PAH), ray's bream (*Brama brama*, RBM), and silverside (*Argentina elongate*, SSI) (Figure 2).

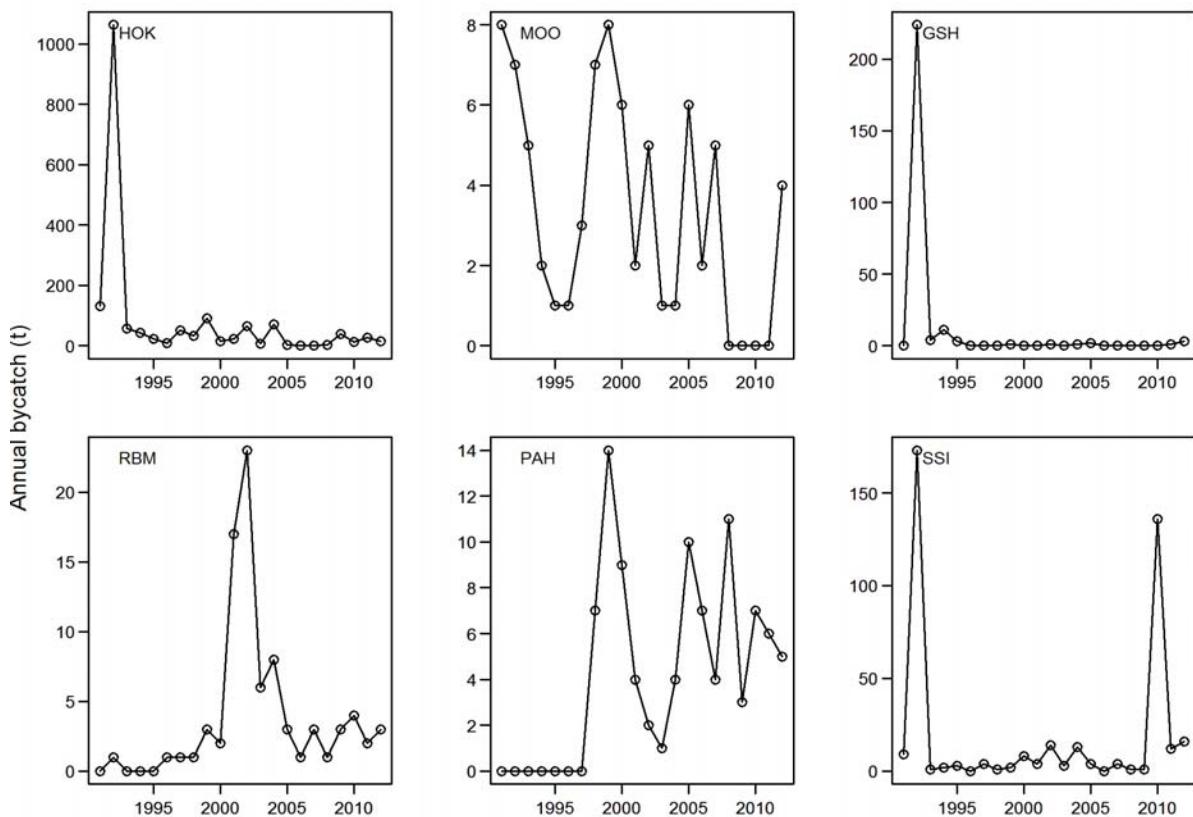

Figure 2: Annual bycatch estimates in the southern blue whiting trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2011–12. See text above for explanation of the species codes.

Scampi trawl fishery

- The most commonly caught bycatch species were javelinfish (*Lepidorhynchus denticulatus*, JAV), unspecified rattails (Macrouridae, RAT), and sea perch (*Helicolenus* spp., SPE).
- Of the 235 bycatch species examined, 51 have shown a decrease in catch over time and 47 an increase in catch.
- The species showing the greatest decline were skates (Rajidae and Arhynchobatidae, SKA), bluenose (*Hyperoglyphe antarctica*, BNS) and alfonsino (*Beryx* spp., BYX) (Figure 3).
- The species showing the greatest increase were Spiny masking crab (*Teratomaia richardsoni*), jackknife prawn (*Haliporoides sibogae*, HSI), and gastropods (Class Gastropoda, GAS) (Figure 3).

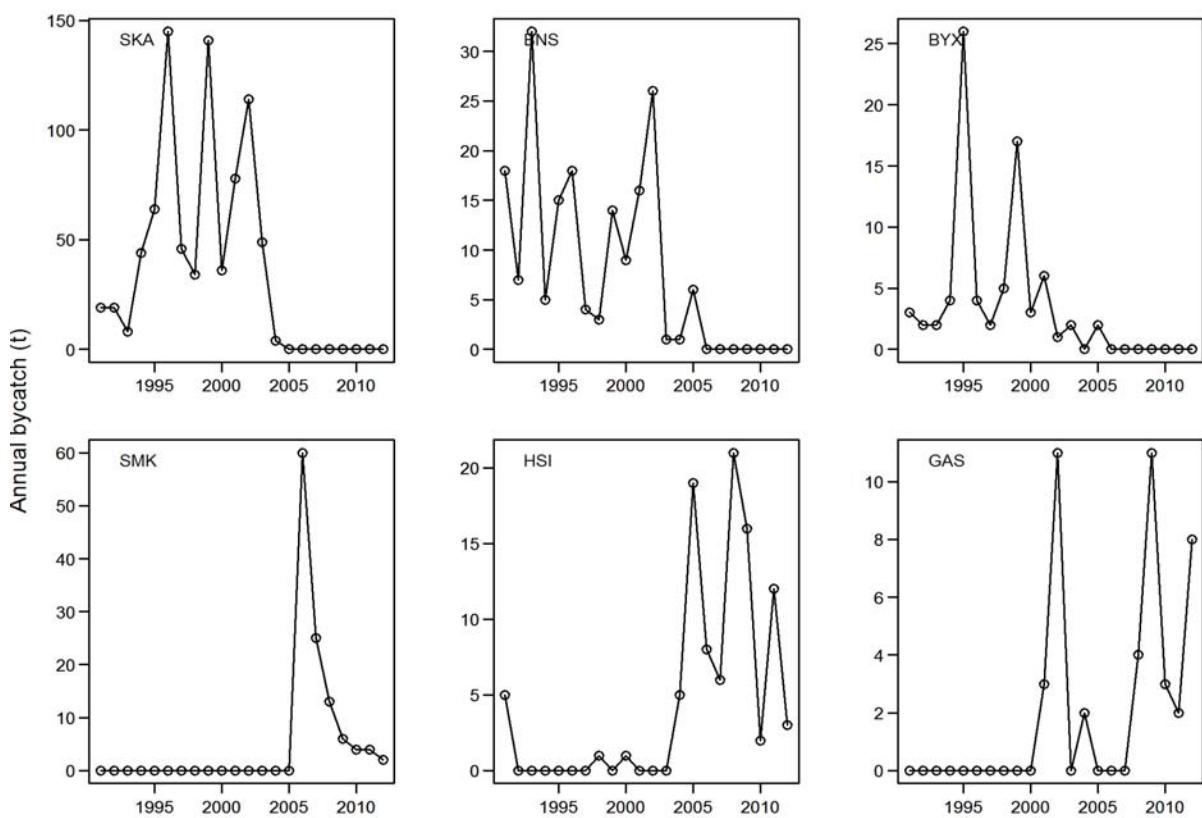

Figure 3: Annual bycatch estimates in the scampi trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2011–12. See text above for explanation of the species codes. Note: skates (SKA) were mainly recorded as rough skate (RSK) or smooth skate (SSK) after 2002–03; spiny masking crabs may not have been well identified before 2004–05.

Jack mackerel trawl fishery

- The most commonly caught bycatch species were barracouta (BAR), blue mackerel (*Scomber australasicus*, EMA), and frostfish (*Lepidopus caudatus*, FRO).
- Of the 117 bycatch species examined, 33 have shown a decrease in catch over time and 18 an increase in catch.
- The species showing the greatest decline were dark ghost shark (GSH), sea perch (*Helicolenus* spp., SPE), and carpet shark (*Cephaloscyllium isabellum*, CAR) (Figure 4).
- The species showing the greatest increase were pilchard (*Sardinops sagax*, PIL), kingfish (*Seriola lalandi*, KIN), and silver dory (*Cyttus novaezealandiae*, SDO) (Figure 4).

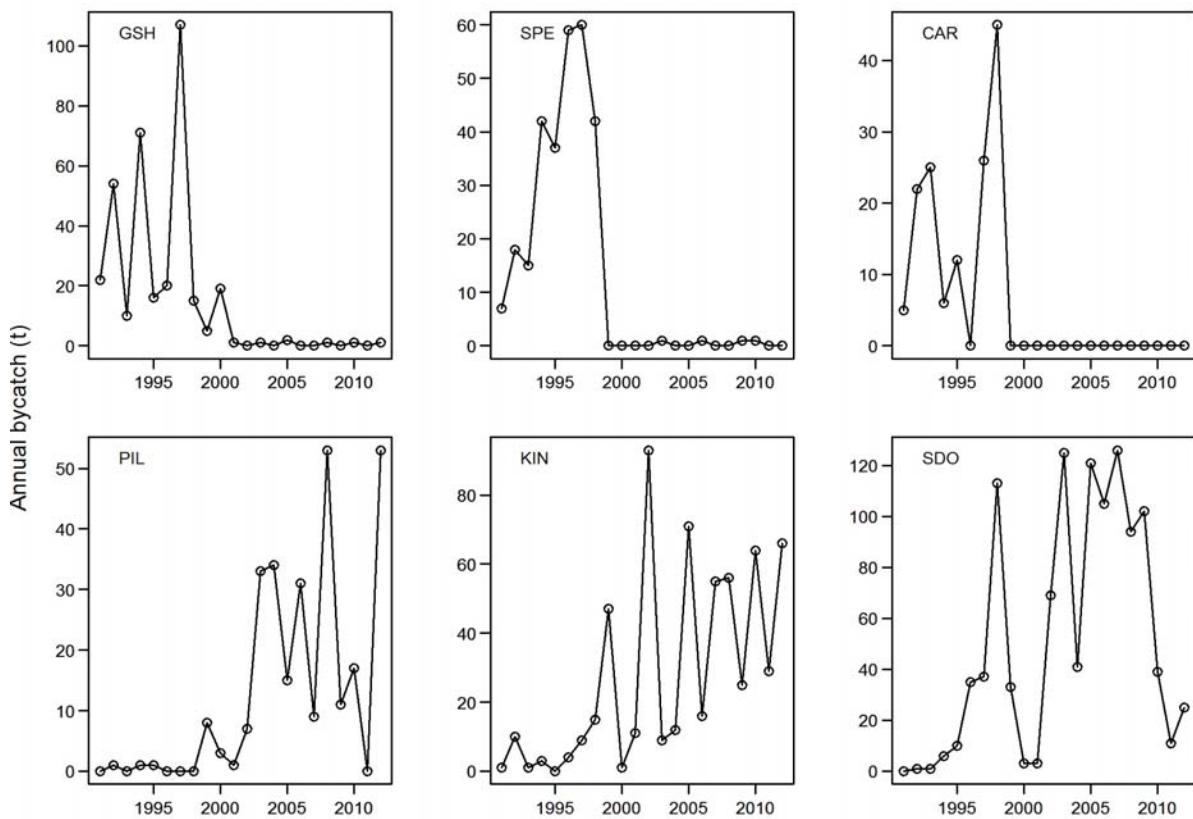

Figure 4: Annual bycatch estimates in the jack mackerel trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2011–12. See text above for explanation of the species codes.

Orange roughy trawl fishery

- The most commonly caught bycatch species were smooth oreo (*Pseudocyttus maculatus*, SSO), black oreo (*Allocyttus niger*, BOE), and black cardinalfish (*Epigonus telescopus*, CDL).
- Of the 209 bycatch species examined, 31 have shown a decrease in catch over time and 41 an increase in catch.
- The species showing the greatest decline were spiny dogfish (SPD), black oreo (*Allocyttus niger*, BOE), and cardinalfishes (Epigonidae, CDL) (Figure 5).
- The species showing the greatest increase were morid cods (Moridae, MOD), longnose velvet dogfish (*Centroscymnus crepidater*, CYP), and bushy hard coral (*Goniocorella dumosa*, GDU) (Figure 5).

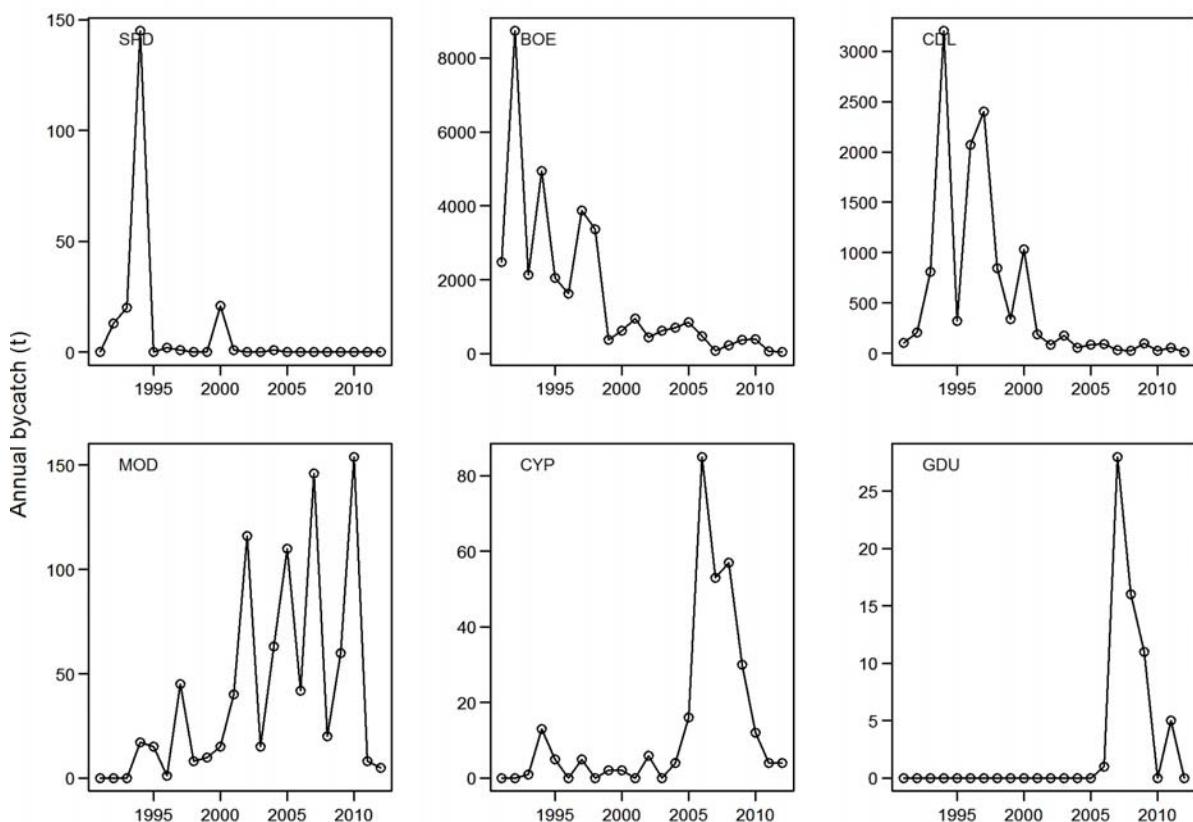

Figure 5: Annual bycatch estimates in the orange roughy trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2011–12. See text above for explanation of the species codes. Note: *Goniocorella dumosa* may not have been well identified before 2005–06.

Oreo trawl fishery

- The most commonly caught bycatch species were orange roughy (*Hoplostethus atlanticus*, ORH), unspecified shark (SHA), and hoki (HOK).
- Of the 117 bycatch species examined, 3 have shown a decrease in catch over time and 28 an increase in catch.
- The species showing the greatest decline were dark ghost shark (GSH), unspecified shark (SHA), and ling (LIN) (Figure 6).
- The species showing the greatest increase were ridge-scaled rattail (*Macrourus carinatus*, MCA), Baxter's lantern dogfish (*Etomopterus baxteri*, ETB), and pale ghost shark (GSP) (Figure 6).

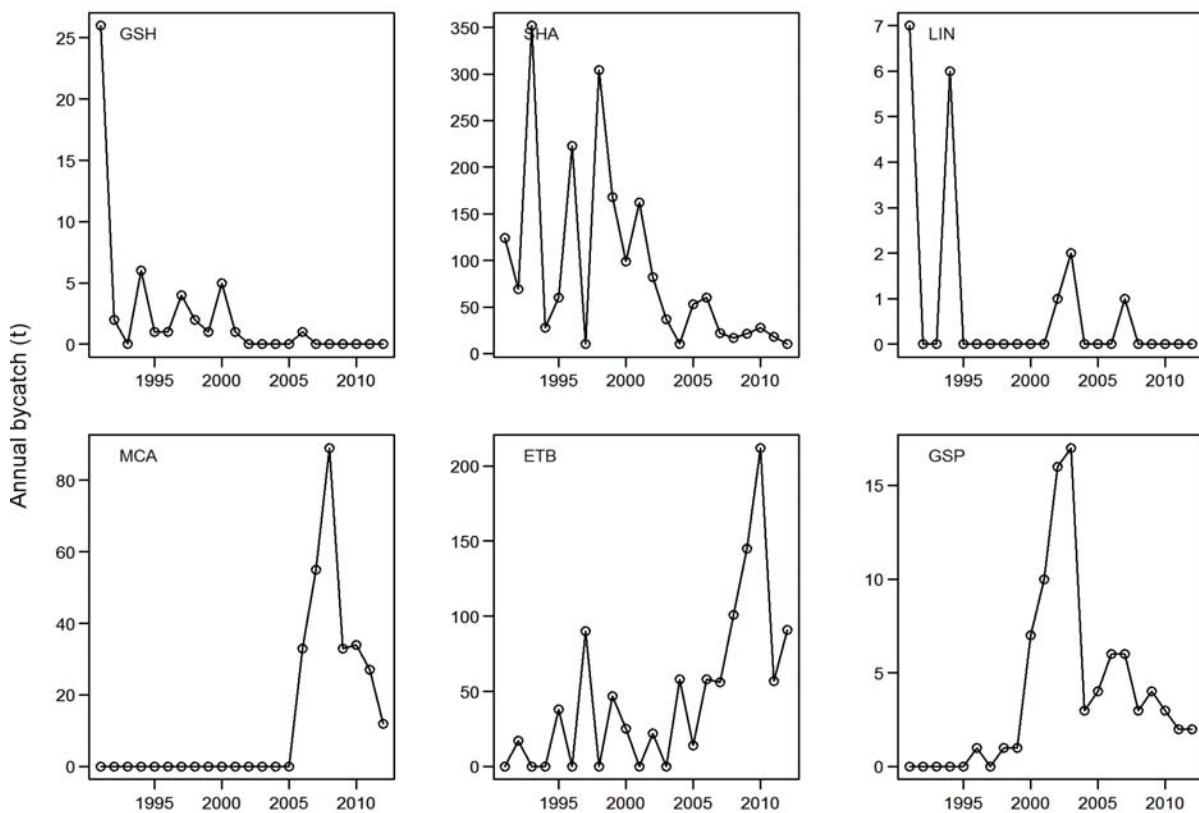

Figure 6: Annual bycatch estimates in the oreo trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2011–12. See text above for explanation of the species codes. Note: sharks (SHA) may have been identified to an increasingly higher taxonomic level over time; rattails such as MCA may not have been well identified in earlier years.

Hoki, hake, ling trawl fishery

- The most commonly caught bycatch species were silver warehou (SWA), javelinfish (JAV), unspecified rattails (Macrouridae, RAT).
- Of the 358 bycatch species examined, 46 have shown a decrease in catch over time and 96 an increase in catch.
- The species showing the greatest decline were skates (SKA), slender jack mackerel (JMM), and dogfishes (*Etmopterus* spp., ETM) (Figure 7).
- The species showing the greatest increase were floppy tubular sponge (*Hyalascus* sp., HYA), umbrella octopus (*Opisthoteuthis* spp.), and scabbardfish (*Benthodesmus* spp., BEN) (Figure 7).

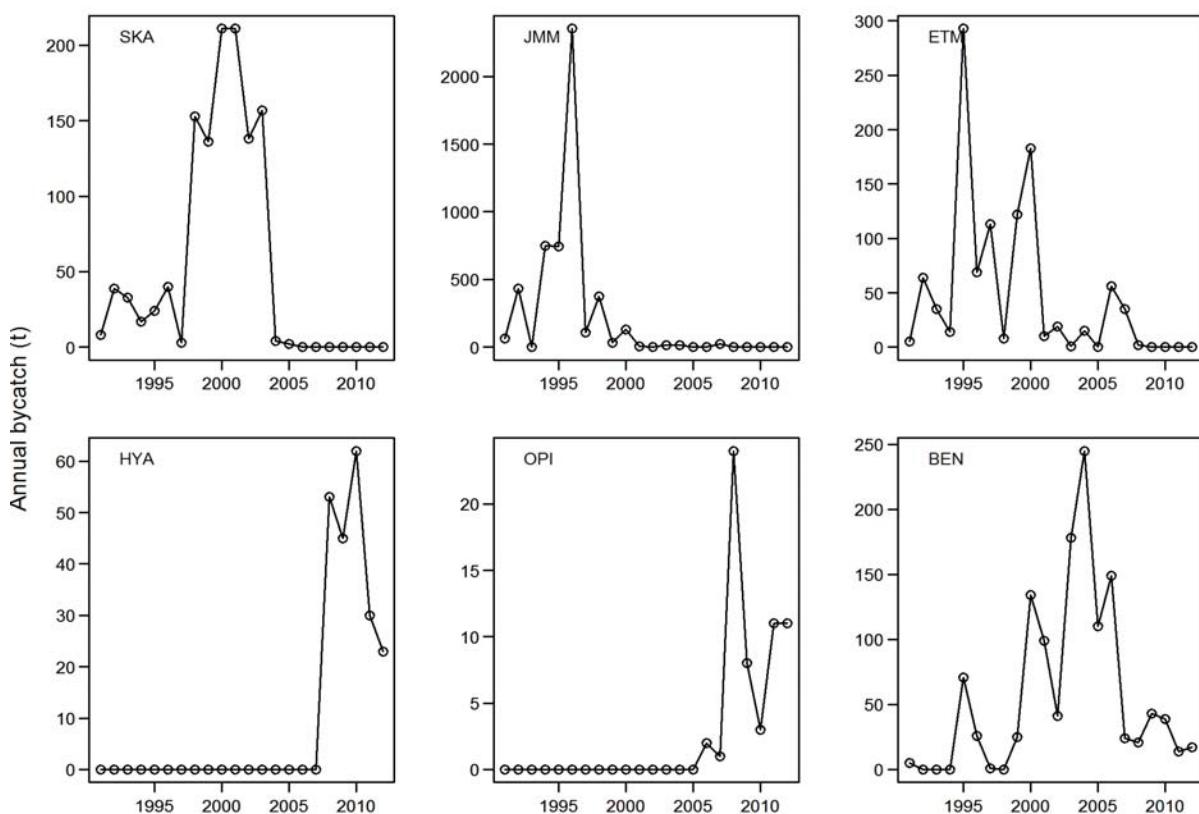

Figure 7: Annual bycatch estimates in the hoki, hake, ling trawl fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1990–91 and 2010–11. See text above for explanation of the species codes. Note: skates (SKA) were mainly recorded as rough skate (RSK) or smooth skate (SSK) after 2002–03; some species (e.g., the sponge HYA and the octopus OPI) may not have been well identified in earlier years.

Ling longline fishery

- Observers began monitoring this fishery in 1992–93, therefore bycatch estimates are not available for 1990–91 and 1991–92.
- The most commonly caught bycatch species were spiny dogfish (SPD), ribaldo (*Mora moro*, RIB), and shovelnose dogfish (*Deania calcea*, SND).
- Of the 119 bycatch species examined, 21 have shown a decrease in catch over time and 38 an increase in catch.
- Among the species showing the greatest decline were bluenose (*Hyperoglyphe antarctica*, BNS), Ray's bream (*Brama brama*, RBM), and hapuku (*Polyprion oxygeneios*, HAP) (Figure 8).
- The species showing the greatest increase were the hairy conger (HCO), hagfish (*Epitrætus cirrhatuſ*, HAG), and pale ghost shark (*Hydrolagus bemisi*, GSP) (Figure 8).

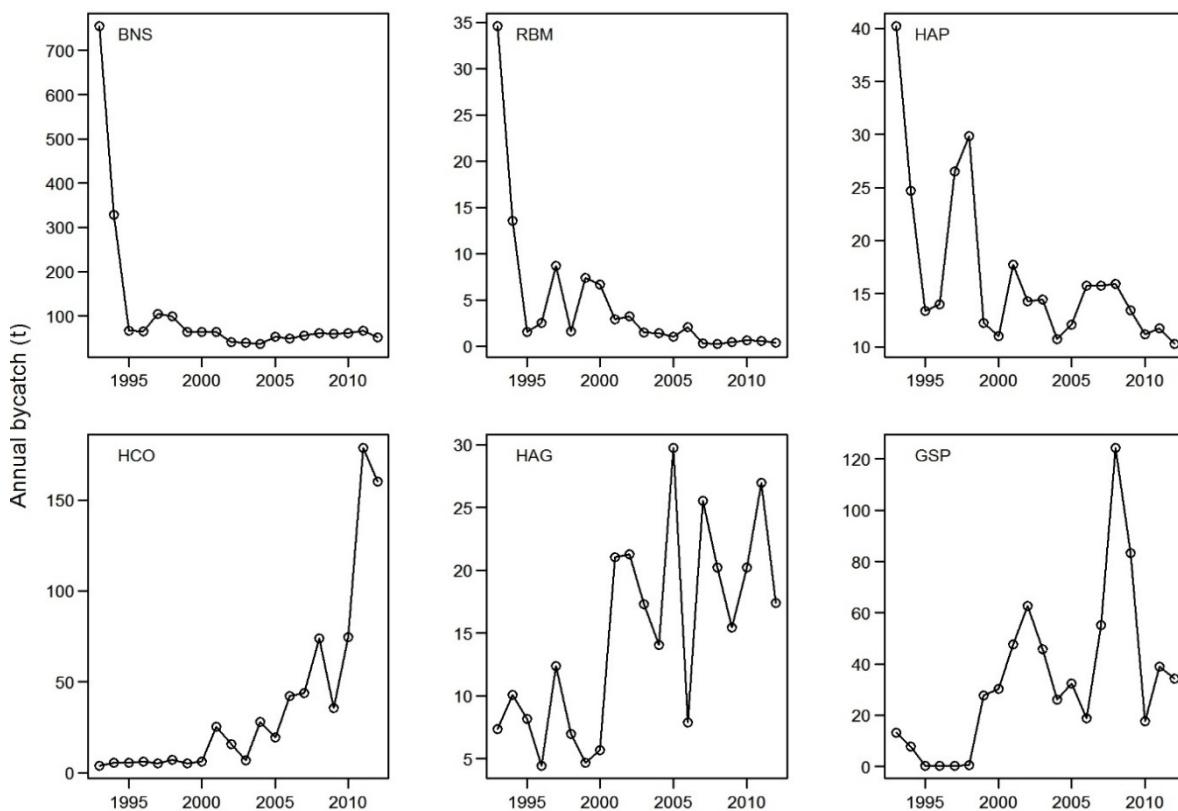

Figure 8: Annual bycatch estimates in the ling longline fishery for the species which have shown the greatest decrease (top) and greatest increase (bottom) between 1992–93 and 2011–12. See text above for explanation of the species codes.

4. POTENTIAL FUTURE ANALYSES

- The use of MPI 3-letter codes to record the observed catch in these fisheries has changed over time. The improved ability of observers to identify components of the catch to a greater taxonomic resolution has meant that some generic codes (e.g., SHA, shark; and CRB, crab) have been used with decreasing frequency, and new codes have been introduced as taxonomic knowledge has improved among both scientists and observers, and as the observer programme and MPI databases have matured. For future analyses a complete examination of these changes should be considered and codes combined where appropriate to improve the value of these summaries.
- Some apparent declines or increases in bycatch may be due to a substantial and persistent change in the area of operation of the fishery, rather than a decline in abundance. Future analyses could consider a spatial examination of species bycatch, where there are sufficient data.
- Graphical summaries could be expanded to include, for example, the key bycatch species in each fishery, in addition to those showing large declines or increases.

5. ACKNOWLEDGMENTS

Thanks to Dan MacGibbon (NIWA) for his review of this report. This project was funded by the Ministry for Primary Industries (Project DAE2010/02).

Table 2: Southern blue whiting trawl fishery. Total annual bycatch estimates (t) for individual species with at least 1 t of estimated bycatch in at least one year, based on observer catch rates; blank cells are <1 t. Species are ordered by decreasing total catch. The slope of a regression through the data points is shown in parentheses alongside each species code (see <http://marlin.niwa.co.nz> for species code definitions).

Table 4: Oreo trawl fishery. Total annual bycatch estimates (t) for individual species with at least 1 t of bycatch in at least one year, based on observer catch rates; blank cells are <1 t. Species are ordered by decreasing total catch. The slope of a regression through the data points is shown in parentheses alongside each species code (see <http://marlin.niwa.co.nz> for species code definitions).

Table 8: Ling longline fishery. Total annual bycatch estimates (t) (with estimated CVs in parentheses) for individual species with at least 0.1 t of bycatch in at least one year, based on observer catch rates. Species are ordered by decreasing total catch. The slope of a regression through the data points is shown in parentheses alongside each species code. See <http://marlin.niwa.co.nz> for species code definitions).

Table 9: Regression slopes for each species/species group and fishery, from Tables 1–8. Slopes indicating a decline in bycatch over time are highlighted in red, and slopes indicating an increase in bycatch over time are highlighted in green. Species/species groups are ordered alphabetically; blank cells = not estimated; LLL = ling longline fishery; HHL = hoki/hake/ling trawl fishery.
